

CSCI 4250/5250 Computer Graphics solution
Homework 6 (Due beginning of class, Tuesday Oct 27th)

- 1) Given the 3D cube example in programs: ortho.js and ortho.html (available on the course web page), if the view position and the orthographic viewing volume is change into each of the following situations, how will the final 2D image change from its original image?

a. `mvMatrix=lookAt(vec3(-4, 0, 0), at, up);` // pMatrix does not change

Shows the cyan square, the left face of the cube, because the eye is now to the left of the cube looking to the center of the cube.

b. `mvMatrix=lookAt(vec3(3, 3, 3), at, up);` // pMatrix does not change

Shows the top, right, and back faces of the cube

c. `mvMatrix=lookAt(vec3(3, 3, 3), at, up);`
`pMatrix=ortho(-3, 3, -3, 3, -1, 1);`

No display, because the cube is outside of the view volume

d. `pMatrix=ortho(-6, 6, -3, 3, 2, 10);` // mvMatrix does not change

The cube is now inside the view volume, between near plane (-2) and far plane (-10). It appears taller than before. The width of the view volume is doubled and the height of the view volume does not change. Therefore, the height of the back side of the cube looks twice as tall as its wide.

e. `pMatrix=ortho(0, 4, 0, 3, 2, 10);` // mvMatrix does not change

Only $\frac{1}{4}$ of the cube (the upper, right $\frac{1}{4}$) is inside the view volume and displayed. The width and height ratio of the displayed portion (back face) is 3:4

2) Given: $\text{mvMatrix} = \text{lookAt}(\text{vec3}(4, 4, -4), \text{at}, \text{up});$
 $\text{pMatrix} = \text{ortho}(-2, 2, -4, 4, -10, 10);$

show:

- the mvMatrix
- the pMatrix
- the coordinates of point F(1, 1, -1) and B(1, 1, 1) when converted into the final clip coordinates.
(show intermediate steps in deriving the results)

$\text{n} = \text{eye} - \text{look} = [4, 4, -4]$

normalized n: $[0.577, 0.577, -0.577]$

$\text{u} = \text{up} \times \text{n} = [0, 1, 0] \times [0.577, 0.577, -0.577]$

normalized u: $[-0.707, 0, -0.707]$

$\text{v} = \text{n} \times \text{u} = [0.577, 0.577, -0.577] \times [-0.707, 0, -0.707]$

normalized v: $[-0.408, 0.816, 0.408]$

$-\text{dot}(\text{n}, \text{eye}) = -6.928$

$-\text{dot}(\text{u}, \text{eye}) = 0$

$-\text{dot}(\text{v}, \text{eye}) = 0$

$$\text{view matrix} = \begin{bmatrix} -0.707 & 0 & -0.707 & 0 \\ -0.408 & 0.816 & 0.408 & 0 \\ 0.577 & 0.577 & -0.577 & -6.928 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\text{projection matrix} = \begin{bmatrix} 0.5 & 0 & 0 & 0 \\ 0 & 0.25 & 0 & 0 \\ 0 & 0 & -0.1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\text{M} = \text{view matrix} \times \text{projection matrix} = \begin{bmatrix} -0.35 & 0 & 0.07 & 0 \\ -0.204 & 0.204 & -0.04 & 0 \\ 0.288 & 0.144 & 0.058 & -6.92 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\text{F}' = \text{M} * \text{F} = \begin{bmatrix} -0.35 & 0 & 0.07 & 0 \\ -0.204 & 0.204 & -0.04 & 0 \\ 0.288 & 0.144 & 0.058 & -6.92 \\ 0 & 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} 1 \\ 1 \\ -1 \\ 1 \end{bmatrix} = \begin{bmatrix} -0.35 - 0.07 \\ -0.204 + 0.204 + 0.04 \\ 0.288 + 0.144 - 0.058 + 6.92 \\ 1 \end{bmatrix} = \begin{bmatrix} -0.42 \\ 0.04 \\ 7.294 \\ 1 \end{bmatrix}$$

$$B' = M * B = \begin{bmatrix} -0.35 & 0 & 0.07 & 0 \\ -0.204 & 0.204 & -0.04 & 0 \\ 0.288 & 0.144 & 0.058 & -6.92 \\ 0 & 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} -0.35 + 0.07 \\ -0.204 + 0.204 - 0.04 \\ 0.288 + 0.144 + 0.058 - 6.92 \\ 1 \end{bmatrix} = \begin{bmatrix} -0.28 \\ -0.04 \\ -6.43 \\ 1 \end{bmatrix}$$

- 3) Changing the orthographic viewing volume in problem 2) to a frustum with left=-2, right=2, bottom=-4, top=4 for the near plane, and the near plane at distance 4 and far plane at distance 10 from the eye/camera. How would you call the perspective function to set up the corresponding pMatrix in the .js program?

Convert Frustum(-2, 2, -4, 4, 4, 10) into perspect

Aspect = (right-left)/(top-bottom) = (2-(-2))/(4-(-4)) = 0.5

viewAngle = 2*arctan(1/2*(top-bottom)/N) = 2*arctan(0.5*(4-(-4))/4)=1.52 radian → 87 degrees

→ perspect(87, 0.5, 4, 10)

- 4) With the perspective viewing volume defined in problem 3), what will be the x and y coordinates of points F(1, 1, -1) and B(1, 1, 1) when projected onto the near plane?

$$F'_x = N * F_x / (-F_z) = 4 * 1 / (1) = 4$$

$$F'_y = N * F_y / (-F_z) = 4 * 1 / (1) = 4$$

F': (4, 4)

$$B'_x = N * B_x / (-B_z) = 4 * 1 / (-1) = -4$$

$$B'_y = N * B_y / (-B_z) = 4 * 1 / (-1) = -4$$

B': (-4, -4)
