Computer Graphics

Introduction to OpenGL Programming

Mary Confe

Motivation

- We won't touch the low levels of rasterization
 - rely on the GPU to perform scan conversion, etc
- · There are a lot of different GPUs out there
 - different brands: ATI, NVIDIA, etc
 - different capabilities
- · Need standard way of interfacing with GPU
 - send vertices, normals, lights, cameras to GPU
 - wait for hardware to do its magic
 - get the rendered image back
- · This is where OpenGL fits in

Middle Tennessee State Universit

What is OpenGL?

- · The Open Graphics Library
 - 3-D graphics API specification
 - raster graphics library
 - pass in vertices, normals, and other scene data
 - · get pixels out
 - industry standard
 - specification publicly available
 - · supported across many platforms
 - Mac OS, Windows, Linux, iPhone, PSP...

Middle Tennessee State University

What is OpenGL?

- OpenGL is a software API to graphics hardware.
 - designed as a streamlined, hardware-independent interface to be implemented on many different hardware platforms
 - Intuitive, procedural interface with C, C++, Java, Perl, Python, ... bindings
 - No windowing commands!
 - No high-level commands for describing models of three-dimensional objects

Middle Tennessee State University

What Is OpenGL?

- A software interface to graphics hardware.
- The interface consists of about 250 commands (functions) to specify the objects and operations needed to produce 2D and 3D graphics
 - OpenGL geometric primitives include points, lines, polylines, and polygons. There is specific support for triangle and quadrilateral polynomials
 - Has texture mapping support.

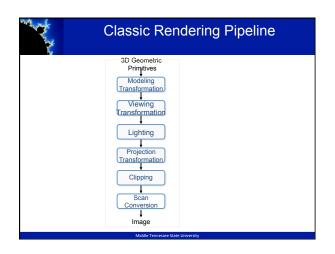

Middle Tennessee State University

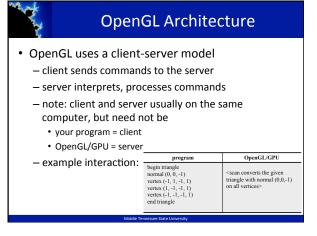

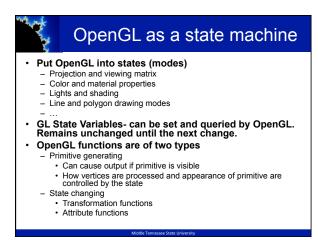

OpenGL Libraries

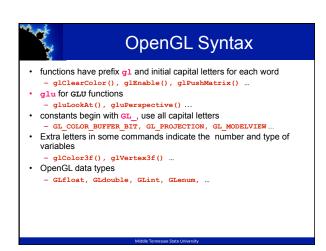

- OpenGL core library
 - OpenGL32 on Windows
 - GL on most unix/linux systems
- OpenGL Utility Library (GLU)
 - Provides functionality in OpenGL core but avoids having to rewrite code
- OpenGL Utility Toolkit (GLUT)
 - Provides functionality common to all window systems
 - Open a window
 - · Get input from mouse and keyboard
 - Get inpu
 Menus
 - Event-driven
 - Code is portable but GLUT lacks the functionality of a good toolkit for a specific platform
 - No slide bars

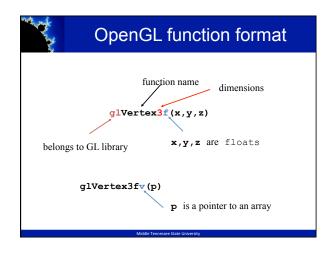

Middle Tennessee State University

OF THE PERSON NAMED IN COLUMN TO PERSON NAME	Open-GL Data Types		
suffix	data type	C/C++ type	OpenGL type name
b	8-bit integer	signed char	GLbyte
s	16-bit integer	Short	GLshort
i	32-bit integer	int or long	GLint, GLsizei
f	32-bit float	Float	GLfloat, GLclampf
d	64-bit float	Double	GLdouble,GLclampd
ub	8-bit unsigned number	unsigned char	GLubyte,GLboolean
us	16-bit unsigned number	unsigned short	GLushort
ui	32-bit unsigned number	unsigned int or unsigned long	GLuint,Glenum,GLbitfield

OpenGL Syntax Examples

Example: Setting the current color using glColor.

- Colors may have 3 components (RGB) or 4 components (RGBA). Think of A (or alpha) as opacity.
- · Floating point color component values range from 0 to 1

```
glColor3f(0.0, 0.5, 1.0);
This is 0% Red, 50% Green, 100% Blue;
glColor4f(0.0, 0.5, 1.0, 0.3);
This is 0% Red, 50% Green, 100% Blue, 30% Opacity
GLfloat color[4] = { 0.0, 0.5, 1.0, 0.3 };
  glColor4fv(color);
Again, 0% Red, 50% Green, 100% Blue, 30% Opacity
```

OpenGL Syntax Examples

 Unsigned byte – color component values range from 0 to 255 (same as C's unsigned char).

```
glColor3ub (0, 127, 255);
This is: 0% Red, 50% Green, 100% Blue
glColor4ub (0, 127, 255, 76);
This is 0% Red, 50% Green, 100% Blue, 76% Opacity
```

Setting Drawing Colors in GL

- glColor3f(red, green, blue);
- -glColor3f(1.0, 0.0, 0.0); // red
 - glColor3f(0.0, 1.0, 0.0); // green
 - -glColor3f(0.0, 0.0, 1.0); // blue
 - glColor3f(0.0, 0.0, 0.0); // black
- -glColor3f(1.0, 1.0, 1.0); // bright white -glColor3f(1.0, 1.0, 0.0); // bright yellow
- glColor3f(1.0, 0.0, 1.0); // magenta
- glColor3f(0.0, 1.0, 1.0); //cyan
- More colors described in the book

Windowing with OpenGL

- OpenGL is independent of any specific window system
- OpenGL can be used with different window systems
 - X windows (GLX)
 - MFC (WGL)

 GLUT provide a portable API for creating window and interacting with I/O devices

GLUT

- · Developed by Mark Kilgard
- · Hides the complexities of differing window system APIs
 - Default user interface for class projects
- Glut routines have prefix glut
 - glutCreateWindow() ...
- · Has very limited GUI interface
- GLUI is the C++ extension of glut that provides buttons, checkboxes, radio buttons, etc.

Glut Routines

Initialization:

glutInit() processes (and removes) command-line arguments that may be of interest to glut and the window system and does general initialization of glut and OpenGL

Must be called before any other glut routines

Display Mode:

The next procedure, <code>glutInitDisplayMode()</code>, performs initializations informing OpenGL how to set up the frame buffer.

Display Mode

GLUT_RGBGLUT_RGBA

- GLUT DEPTH

- GLUT_INDEX

Use indexed colors (not recommended) - GLUT_DOUBLE

Use double buffering (recommended) Use single buffering (not recommended)

Meaning

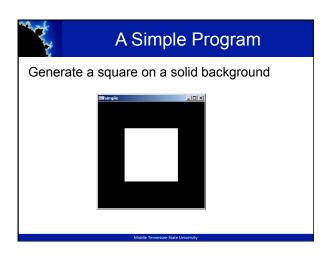

Use RGB colors

- GLUT_SINGLE

Use depth-buffer (for hidden surface removal.)

Use RGB plus alpha (for transparency)

```
if using Windows, include the following
    #include <Windows.h>
    #include <gl/GL.h>
    #include <gl/GLU.h>
    #include <gl/glut.h>

if using linux, include the following
    #include <GL/glut.h>
compile with:
gcc program.cpp -o RunProgram -I/usr/X11R6/include/ -L/usr/
    X11R6/lib -IX11 -IXi -lglut -IGL -IGLU

if using Mac OS X, include these:
    #include <OpenGL/gl.h>
    #include <OpenGL/glu.h>
    #include <GLUT/glut.h>
#include <GLUT/glut.h>
```

```
cube.cpp

int main(int argc, char** argv)
{
    glutInit(&argc,argv)
    glutInitDisplayMode (GLUT_SINGLE | GLUT_RGB);
    glutInitWindowSize(Width,Height);
    glutInitWindowPosition(0,0);
    glutCreateWindow("Display Cube");
    glutDisplayFunc(Draw);

    MyInit();
    glutMainLoop();
    return 0;
}
```

```
cube.cpp

void Draw()
{
    glClear(GL_COLOR_BUFFER_BIT);

    glBegin(GL_POLYGON);
        glVertex2f(-0.5, -0.5);
        glVertex2f(-0.5, 0.5);
        glVertex2f(0.5, 0.5);
        glVertex2f(0.5, -0.5);
        glVertex2f(0.5, -0.5);
        glFlush();
}

Moddle Tennessee State University
```

```
closer Look at the main()

int main(int argc, char** argv)
{
    glutInit(&argc,argv);
    glutInitDisplayMode(GLUT_SINGLE|GLUT_RGB);
    glutInitWindowSize(Width,Height);
    glutInitWindowPosition(0,0);
    glutCreateWindow("Display Cube");
    glutDisplayFunc(draw);

    MyInit();
    set OpenGL state
    glutMainLoop();
    return 0;
    enter event loop
}
```

```
MyInit()
                               black clear color
void MvInit()
  glclearcolor (0.0, 0.0, 0.0, 1.0); opaque window
  glColor3f(1.0, 1.0, 1.0); — fill/draw with white
  glMatrixMode (GL_PROJECTION);
  glLoadIdentity ();
  gluOrtho2D(-1.0, 1.0, -1.0, 1.0);
                                Define clipping window
```

Callbacks

- Virtually all interactive graphics programs are event
- Glut uses callbacks to handle events
 - Windows system invokes a particular procedure when an event of particular type occurs.
 - MOST IMPORTANT: display event
 - · Signaled when window first displays and whenever portions of the window reveals from blocking window
 - glutDisplayFunc(void (*func) (void)) registers the display callback function
- Running the program: glutMainLoop ()
 - Main event loop. Never exit()

Basic Drawing in OpenGL

- · We have learned how to create a window
- Simple 2D drawing
 - No lighting and shading
- OpenGL coordinate system has different origin from the window system
 - Uses lower left corner instead of upper left corner as origin

OpenGL Drawing

- · Steps in the display function
 - 1. Clear the window
 - 2. Set drawing attributes
 - 3. Send drawing commands
 - 4. Flush the buffer

Step 1: Clear the Window

- glClear(GL COLOR BUFFER BIT)
 - clears the frame buffer by overwriting it with the background color.
 - Background color is a state set by glClearColor(GLfloat r, GLfloat g, GLfloat b, GLfloat a) in MyInit().
- void glClear(Glbitfield mask)
 - -Four masks:
 - · GL_COLOR_BUFFER_BIT
 - · GL DEPTH BUFFER BIT
 - GL_ACCUM_BUFFER_BIT

GL_STENCIL_BUFFER_BIT

Step 2: Drawing Attributes: Color

- glColor3f(GLfloat r, GLfloat g, GLfloat b) sets the drawing color
 - glColor3d(), glColor3ui() can also be used
 - Remember OpenGL is a state machine
 - Once set, the attribute applies to all subsequent defined objects until it is set to some other value
 - glcolor3fv() takes a flat array as input

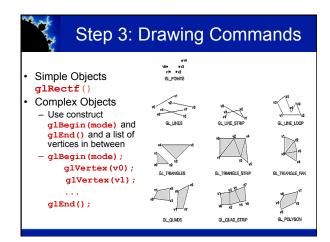

Step 2: Drawing Attributes

- Besides glvertex() commands, other attributes commands can also be used between glBegin() and glEnd(), e.g. glColor3f().
- There are more drawing attributes than color
 - Point size: glPointSize()
 Line width: glLinewidth()
 - Dash or dotted line: glLineStipple()
 - Polygon pattern: glPolygonStipple()

– ...

liddle Tennessee State Universit

No. of

Drawing Lines

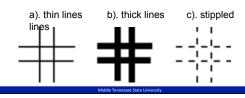

- glBegin (GL_LINES); //draws one line
 glVertex2i (40, 100); // between 2 vertices
 glVertex2i (202, 96);
- glEnd ();
- glFlush();
- If more than two vertices are specified between glBegin(GL_LINES) and glEnd() they are taken in pairs, and a separate line is drawn between each pair.

Middle Tennessee State University

Line Attributes

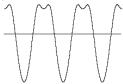

- · Color, thickness, stippling.
- glColor3f(); sets color.
- glLineWidth(4.0); sets thickness. The default thickness is 1.0.
- glLineStipple(2, 0x777);

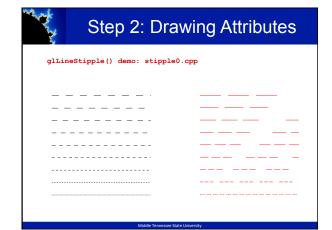

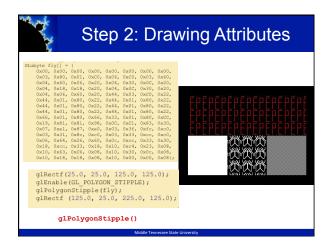

Graphing

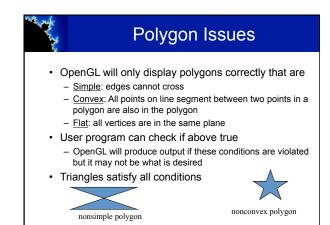

- Drawing line graphs: connect each pair of (x, f(x)) values
- How would you design a program to accomplish this?

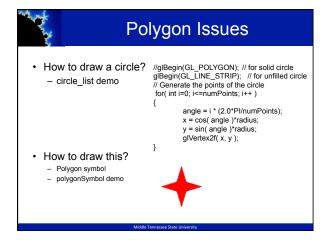

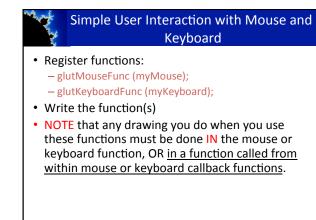

Middle Tennessee State University

Mary Control

Example Mouse Function

- void myMouse(int button, int state, int x, int y);
- Button is one of GLUT_LEFT_BUTTON, GLUT_MIDDLE_BUTTON, or GLUT_RIGHT_BUTTON.
- State is GLUT_UP or GLUT_DOWN.
- X and y are mouse position at the time of the event.

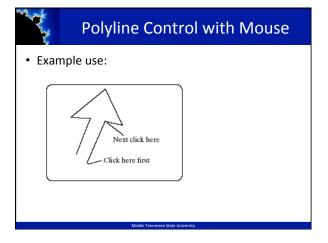

iddle Tennessee State University

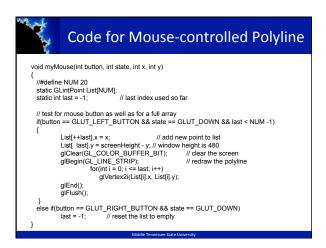

Example Mouse Function

- The x value is the number of pixels from the left of the window.
- The y value is the number of pixels down from the top of the window.
- In order to see the effects of some activity of the mouse or keyboard, the mouse or keyboard handler must call either myDisplay() or glutPostRedisplay().

Middle Tennessee State Universit

Mary Park

Using Mouse Motion Functions

- glutMotionFunc(myMovedMouse);
 - // moved with button held down
- glutPassiveMotionFunc(myMovedMouse);
 - // moved with buttons up
- myMovedMouse(int x, int y);
 - x and y are the position of the mouse when the event occurred.
- Code for drawing rubber rectangles using these functions is in Fig. 2.41.

Middle Tennessee State University

Example Keyboard Function

- Parameters to the function will always be (unsigned char key, int mouseX, int mouseY).
- The y coordinate needs to be flipped by subtracting it from screenHeight.
- Body is a switch with cases to handle active keys (key value is ASCII code).
- · Remember to end each case with a break!

Middle Tennessee State Universit

Example Keyboard Function

ddle Tennessee State University

Using Menus

- Both GLUT and GLUI make menus available.
- GLUT menus are simple, and GLUI menus are more powerful.
- Menus can be used to allow users to select options during the execution of your program
